

## schooling etc. up until now.

I have gone through primary school, which takes nine years to complete in Finland. From my experience it was rather lackluster, with only a few useful and/or interesting subjects being taught. After primary school I studied for a degree in Information- and communications technologies, at Business College Helsinki. I personally enjoyed my time there significantly more than the years I spent in primary school, as the subjects I was taught were more aligned with my interests. My only gripes with it are that I feel I was not taught enough, and that the pace was a bit sluggish. Lastly, I've studied in Metropolia for around half a year, where I'm aiming for a bachelor's degree in ICT.

My mandatory conscription is slated to start this summer (2026). It will last half a year, so I'm not particularly bummed about it. As it's only one eighteenth the length of primary school, which was a similar mandatory roadblock for my life.

I have had two experiences with jobs so far, one in a graveyard, and the other in a library. I enjoyed both overall.

I'm not sure what "striving to study" means as a subject, so I can't really write much about it. If it's supposed to mean "how I'm going to continue my studies in the future" then I'll say that I will most likely just look for work after I complete my bachelor's degree.

## interpreting the following.

"A bachelor's degree lasts four years and takes up 240 credits. It includes at least six months total of an internship at one or more companies. The internship(s) is usually performed over the summer vacation, but it is also possible to get it done during the semesters. The first year is comprised of two themes; software and hardware. Both themes are studied for two sets of eight weeks, during which students will study subjects such as. mathematics, physics, English and communication, programming etc. At the end of the first year, students will choose a specialization, and professional studies will be more in-depth in the coming semesters. Specialization options are wellness and healthcare technology, software production, game development, web development and digital media, and smart IoT-systems.

The thesis will be done in cooperation with a company which works in this field. It usually involves solving a technical problem systematically, and a 40-50 page long report will be written about the project. It is called a bachelor's thesis. The degree, which I'm studying for, is called a bachelor's degree in engineering. My business card will most likely have "Information technology engineer" written on it in Finnish.
